PILAR

Asset dependencies

José A. Mañas <jmanas@pilar-tools.com>

October 2020

SRA > method > assets

- Magerit
 - resources of the information system, or related to it, necessary so that the organisation works correctly and reaches the objectives proposed by its direction
- ISO
 - Asset. Anything that has value to the organization

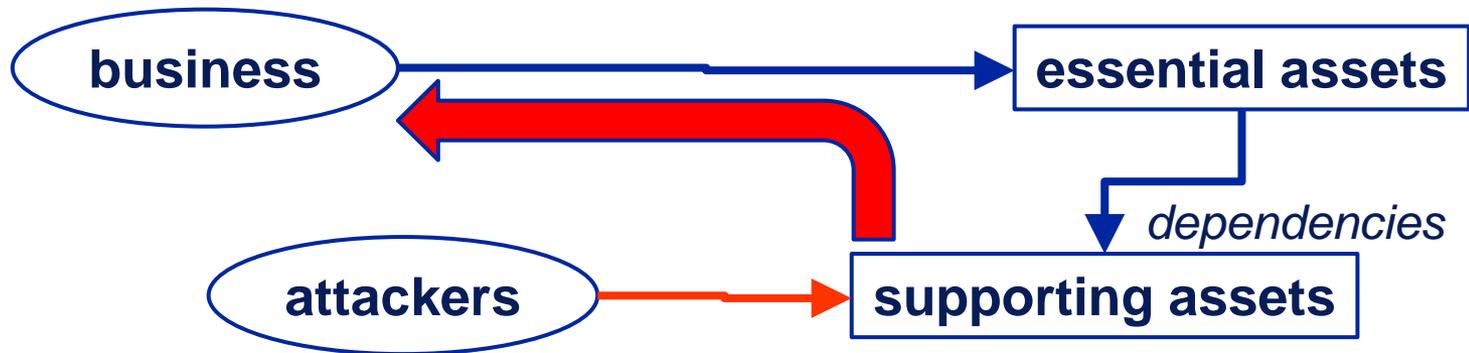

SRA > method > assets

- essential assets
 - information and services
 - have a value for the business → security requirements
- supporting assets
 - equipment, communications, media, facilities and personnel
 - have no value by themselves, but the value inherited from the business they support (i.e. essential assets)
 - may be subject to incidents
 - accidental
 - deliberate

P

SRA > method > requirements & consequences

1. business requirements are used as essential assets value
2. value is transferred to supporting assets

3. attackers act on supporting assets
4. consequences are transferred back onto business impact

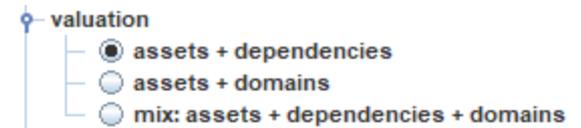

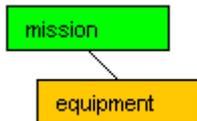

SRA > method > assets

- what is an asset?
how to identify assets?
- formal: an asset is anything that has value for the organization
 - direct value: essential assets
 - indirect value: supporting assets
- heterodox
 - an asset is anything that may be subject to attack / incident
 - a [structuring] asset is a node that helps to model the transfer of value between assets
 - an asset is a grouping of assets that provide a service
 - i.e. a Service Access Point (e.g. a vpn)

dependencies

- Asset A depends on asset B
 - The security requirements on A are transferred onto B
 - [direct] risks B are transferred onto deflected (indirect) risks on A

[dependencies] A.1.4. valuation of assets

Edit Export Import

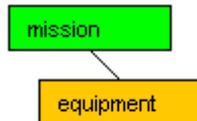

asset	[A]	[I]	[C]	[Auth]	[Acc]	[V]	[PD]
ASSETS							
example 1							
is [mission]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment]	[3]	[4]	[5]	[6]	[7]		[8]

1 sources own value mark

dependencies

- Asset A depends on asset B
 - [direct] risks B are transferred onto deflected (indirect) risks on A

transfer tuning

- Asset A depends on asset B
 - you may tune the transfer of values per dimension

The screenshot displays two windows from a software application. The top window, titled "[dependencies] A.1.3. dependencies", shows a tree view of assets. The left pane, labeled "FATHERS", shows a tree where "is [mission]" is the parent of "A [equipment 2]". The right pane, labeled "CHILDREN", shows "A [equipment 2]" as a child of "is [mission]". The bottom window, titled "[dependencies] A.1.4. valuation of assets", shows a table with columns for asset names and dimensions [A], [I], [C], [Auth], [Acc], [V], and [PD]. The table contains numerical values for each asset and dimension combination.

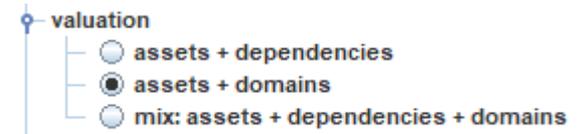

asset	[A]	[I]	[C]	[Auth]	[Acc]	[V]	[PD]
[example 1]							
is [mission]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment 2]	[0]	[1]	[4]	[6]	[7]		[8]

asset dependencies

domain valuation

- In each security domain,
 - the aggregated requirements of all essential assets
 - is assigned to every asset in the domain

[dependencies] A.1.4. valuation of assets

Edit Export Import

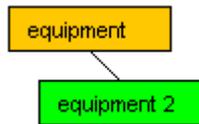

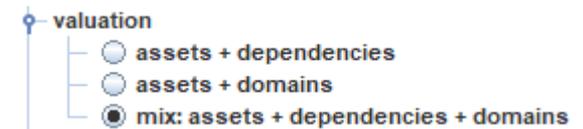

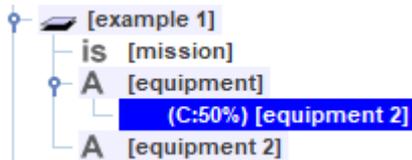

asset	[A]	[I]	[C]	[Auth]	[Acc]	[V]	[PD]
ASSETS							
☺ [example 1]							
is [mission]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment]	[3]	[4]	[5]	[6]	[7]		[8]
☺ [example 2]							
I [essential.info]							
A [D.conf]							

☺ - 1 + sources own value mark

mix valuation

- In each security domain,
 - the aggregated requirements of all essential assets
 - are assigned to every asset in the domain
 - unless the asset has incoming dependencies, in which case the dependencies have priority

[dependencies] A.1.5. valuation of assets

Edit Export Import

asset	[A]	[I]	[C]	[Auth]	[Acc]	[V]	[PD]
ASSETS							
[example 1]							
is [mission]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment]	[3]	[4]	[5]	[6]	[7]		[8]
A [equipment 2]			[4]				

[-] 1 [+] sources own value mark [save] [happy] [question] [sad]

cross-dimension propagation

- The classes of the asset below may condition the transfer of value to protect above

[dependencies] A.1.4. valuation of assets

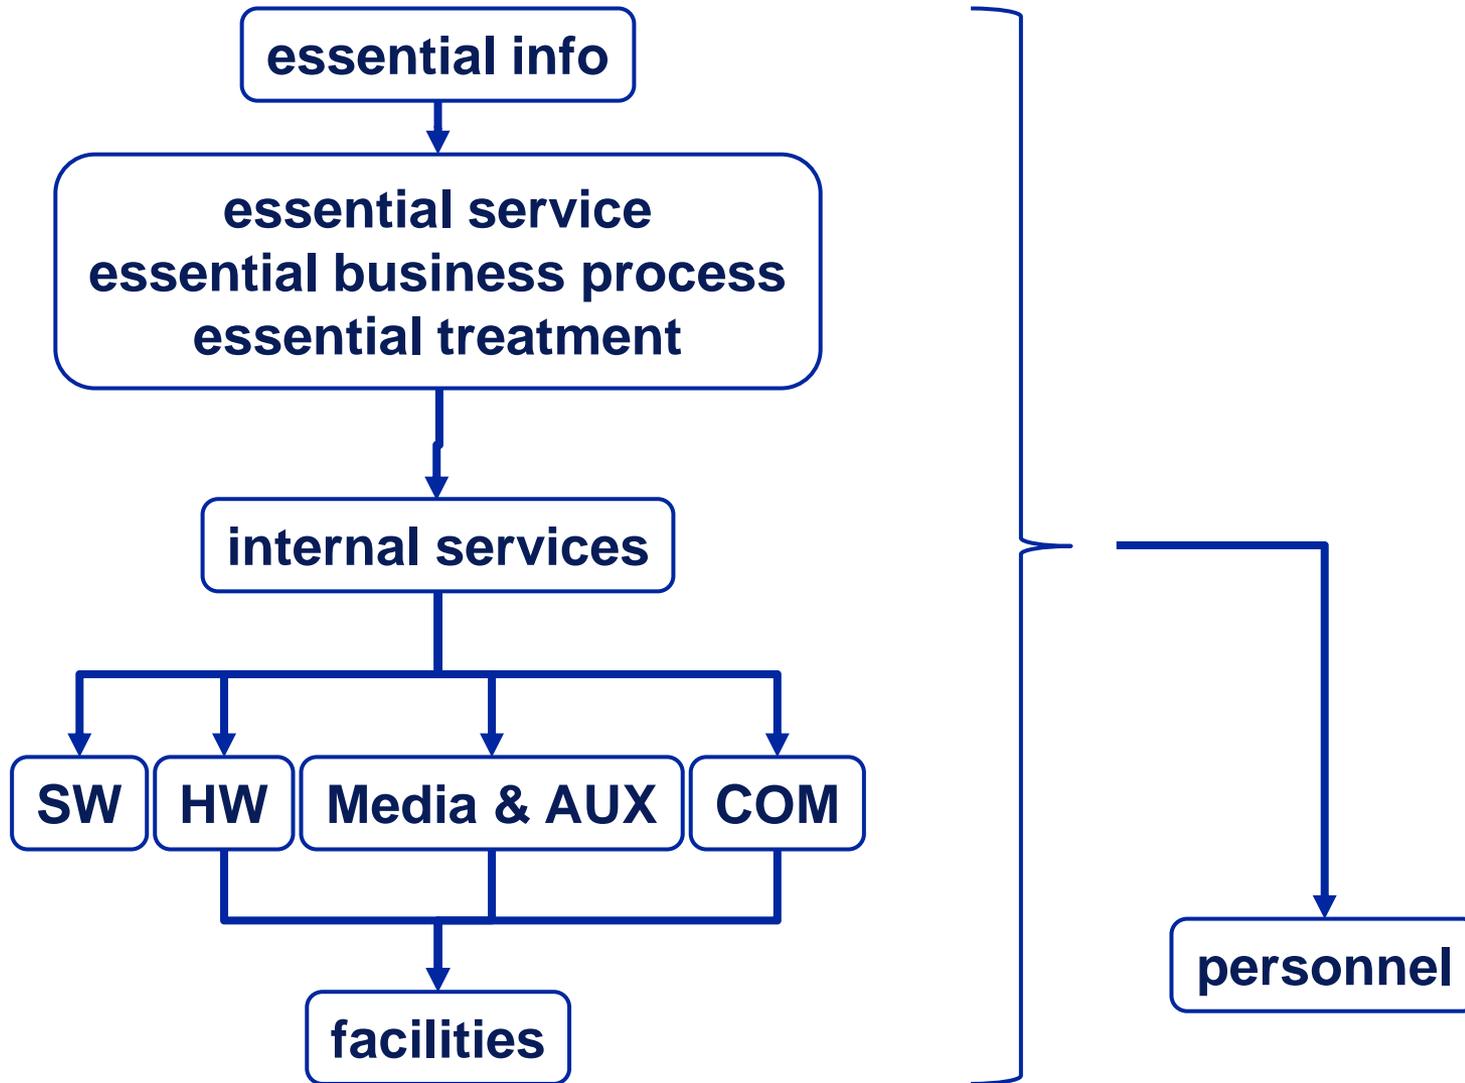

Edit Export Import

A [D.conf]	[8]	[7]		[7]			
A [COM.vpn]	[8]						

sources own value mark

standard dependencies

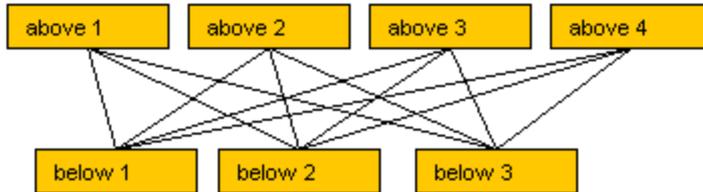

personnel

- essential info → internal users
- services, sw, hw, media, com
 - system operators and administrators
- sw → developers
- facilities → guards

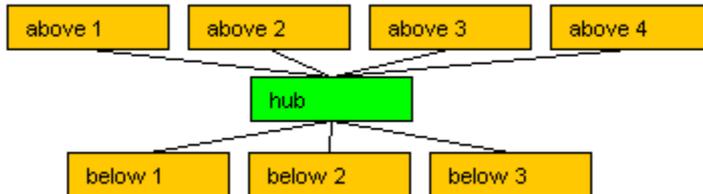

value distributors

- When there are many-to-many dependencies, the graph is a mess

- You may simplify using service access points

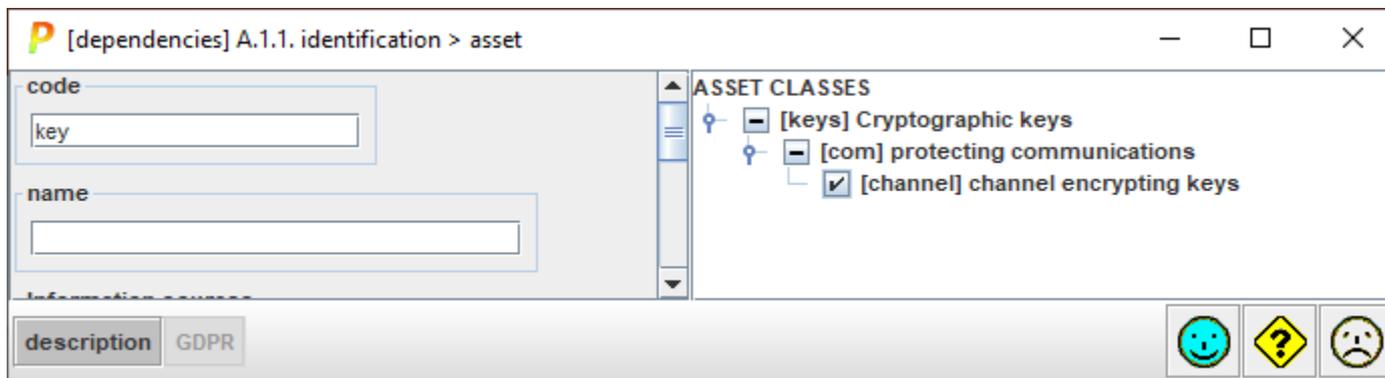

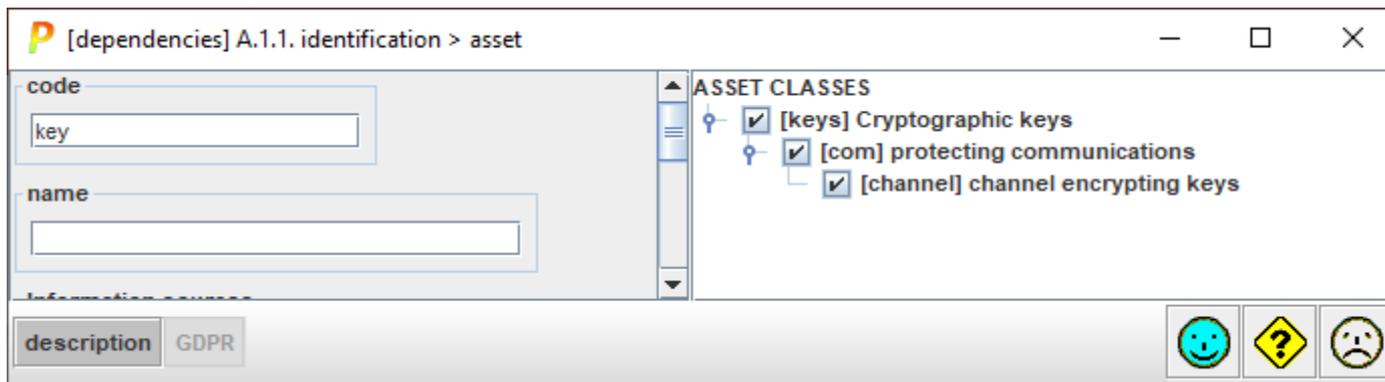

- Now, you may add / remove easily new clients above or new servers below
- It is called object-oriented assets

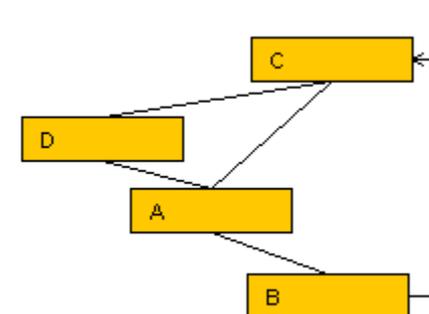

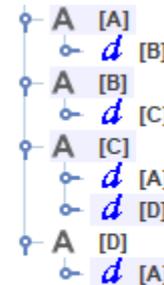

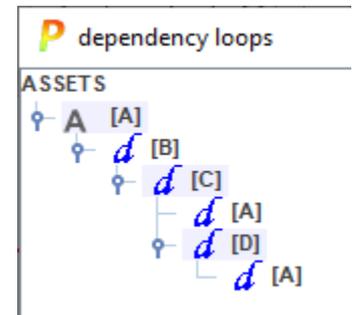

- Can I double check that dependencies are right?
- In fact, you should!
 - go to asset valuation
 - switch accumulated values on
 - revise that every supporting asset has a valid value
- Trick
 - is the accumulated value makes sense, it does not matter if the dependencies are right or wrong: the outcome is fine
 - however, poor dependencies may become a nightmare for project maintenance in the future
- Trick
 - if an asset is not valuated, it means it has no security requirements; most likely you forgot some dependency

- Marking both general and detail
 - it makes no semantics difference
 - marking only leaves looks cleaner (recommended)

- Loops
 - you can set circular loops
 - it is easy to be confused with circular loops
- You can specify behavior of PILAR w.r.t. loops
 - EDIT > options > advanced > ...
 - allow – default in early versions
 - warn – still the loop is allowed
 - no – you cannot set up a circular dependency
- If the model has loops, you identify and edit
 - SELECT > loops

any question?
